

# FROM AVOIDANCE TO OFFSETS: HOW TO MEASURE BIODIVERSITY TO NET GAIN AMBITION

**Sophia L Raithel**

*Senior Technical Specialist, Fauna & Flora  
United Kingdom*

Sophia.Raithel@fauna-flora.org

<https://www.fauna-flora.org/>

## About Fauna & Flora

**We are an international nature conservation organisation.**

**We work closely with local conservation partners around the world in 46 countries to save nature together.**

**We harness this collective expertise to inspire positive change globally.**

# Business & Nature

|                                      |  |  |
|--------------------------------------|--|--|
| Strategic partnerships               |  | With leading businesses to create and implement best practice  |
| Global influence                     |  | Working with global initiatives, government and funders to create enabling frameworks, standards, policies and legislation |
| Supporting Fauna & Flora geographies |  | Responding to threats and opportunities  |
| Thought leadership                   |  | Global trends, good practice guidance  |
| Collaborative initiatives            |  | Collective practical action to restore nature  |
| Education & capacity-building        |  | Business, government, NGOs and communities   |
| Philanthropic partnerships           |  | Philanthropy, nature positive  |

*Our strengths – long history of working with companies on biodiversity/net positive; strong technical skills; understanding ‘grass roots’ conservation; advising on metrics, verifying approach, measuring impact*

**Can EIA facilitate the transition to net gain and nature positive mechanisms?**

# NPI roadmap from mitigation to enhancement?

# Common baseline assessment components and gaps

## Conventional components of baseline

- Quantified area of expected disturbance by natural, modified and critical habitat loss
- Mapped spatial extent of ecosystem or habitat
- Identification of national and global ecosystem
- List of likely occurring species by taxa
- Species as listed on IUCN and national red lists
- Ecosystem services and processes identified

## Challenges for quantification \*

- Lack of indicators that provide quantitative assessment of the condition or quality of an ecosystem
- Lack of long term thinking and planning to enable net gain approaches

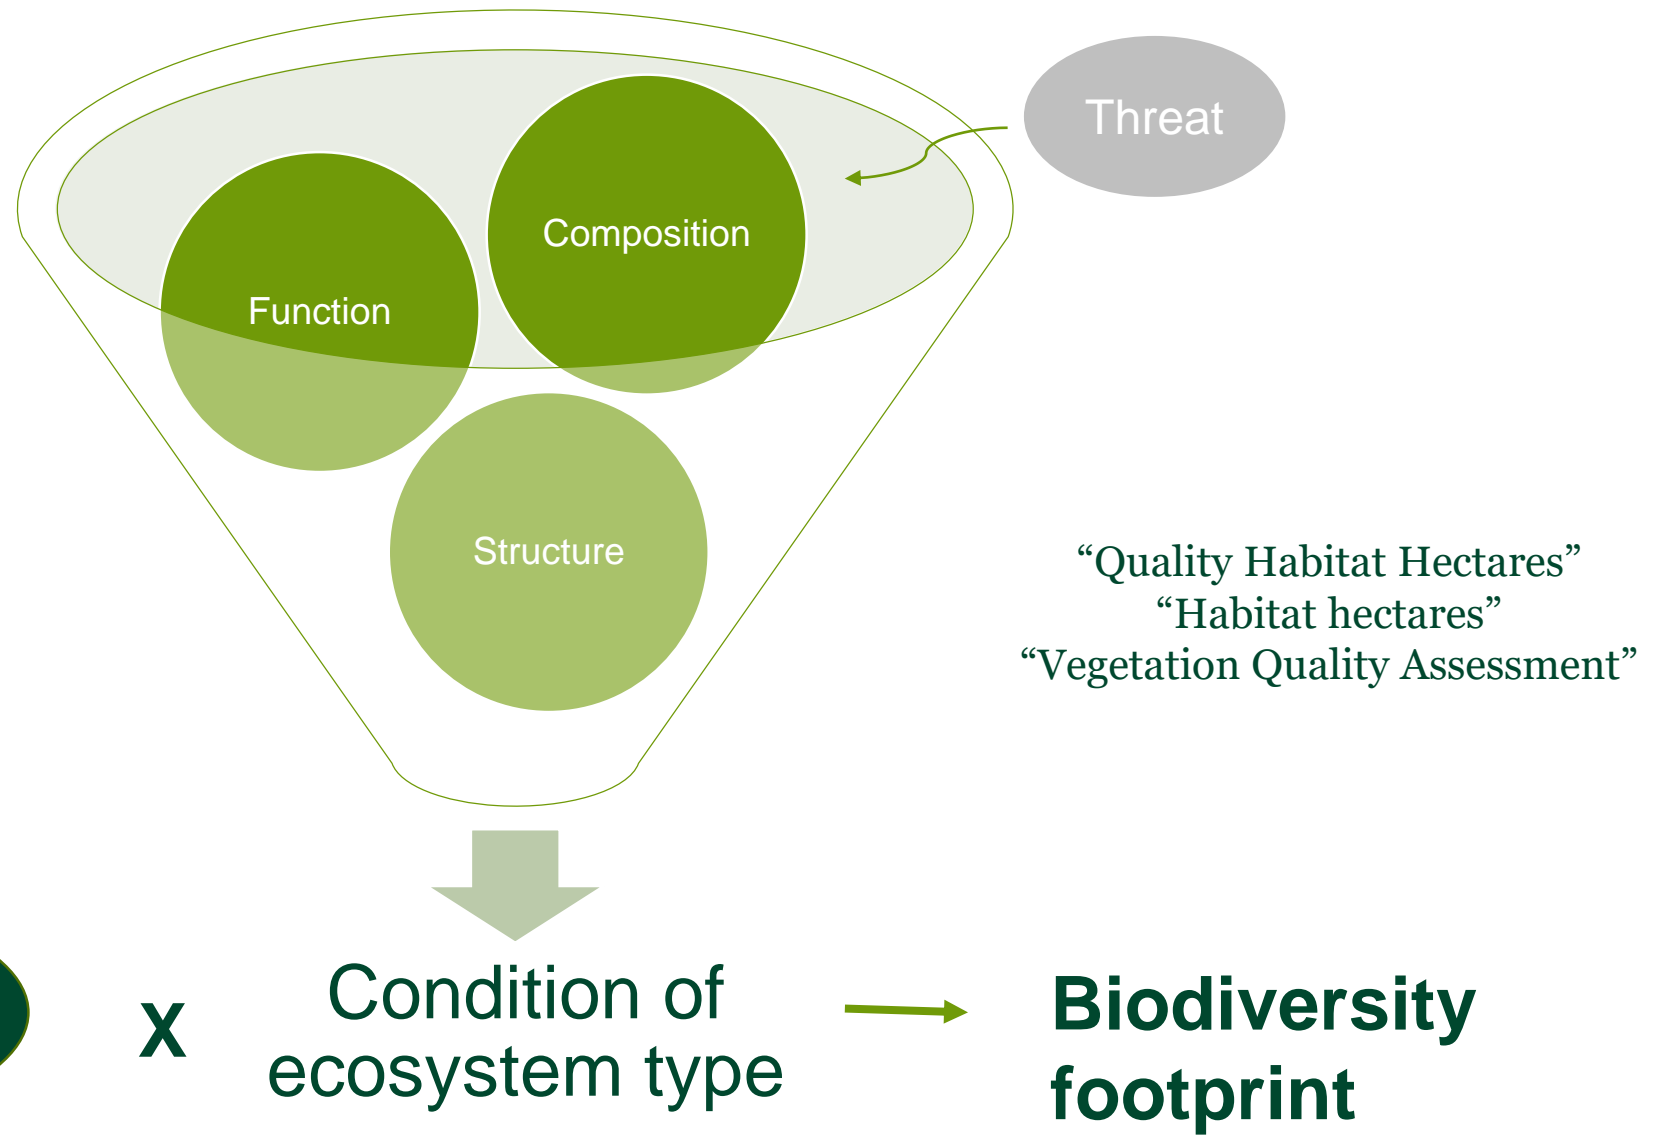

\* *Existing projects*

A wide-angle landscape photograph of a mountain range. The foreground and middle ground are dominated by dense, dark green forests. A thick layer of white mist or fog fills the valleys and lower slopes, creating a 'sea of clouds' effect. The background shows more distant, hazy mountain peaks under a pale, overcast sky. The overall atmosphere is serene and ethereal.

**Applying an ecosystem area and  
condition into one metric**

# Key concepts

|            |                            |
|------------|----------------------------|
| <b>Key</b> |                            |
|            | Components of an ecosystem |
|            | Attributes                 |

**Condition**

**Composition**

**Structure**

**Function**

*Threat*

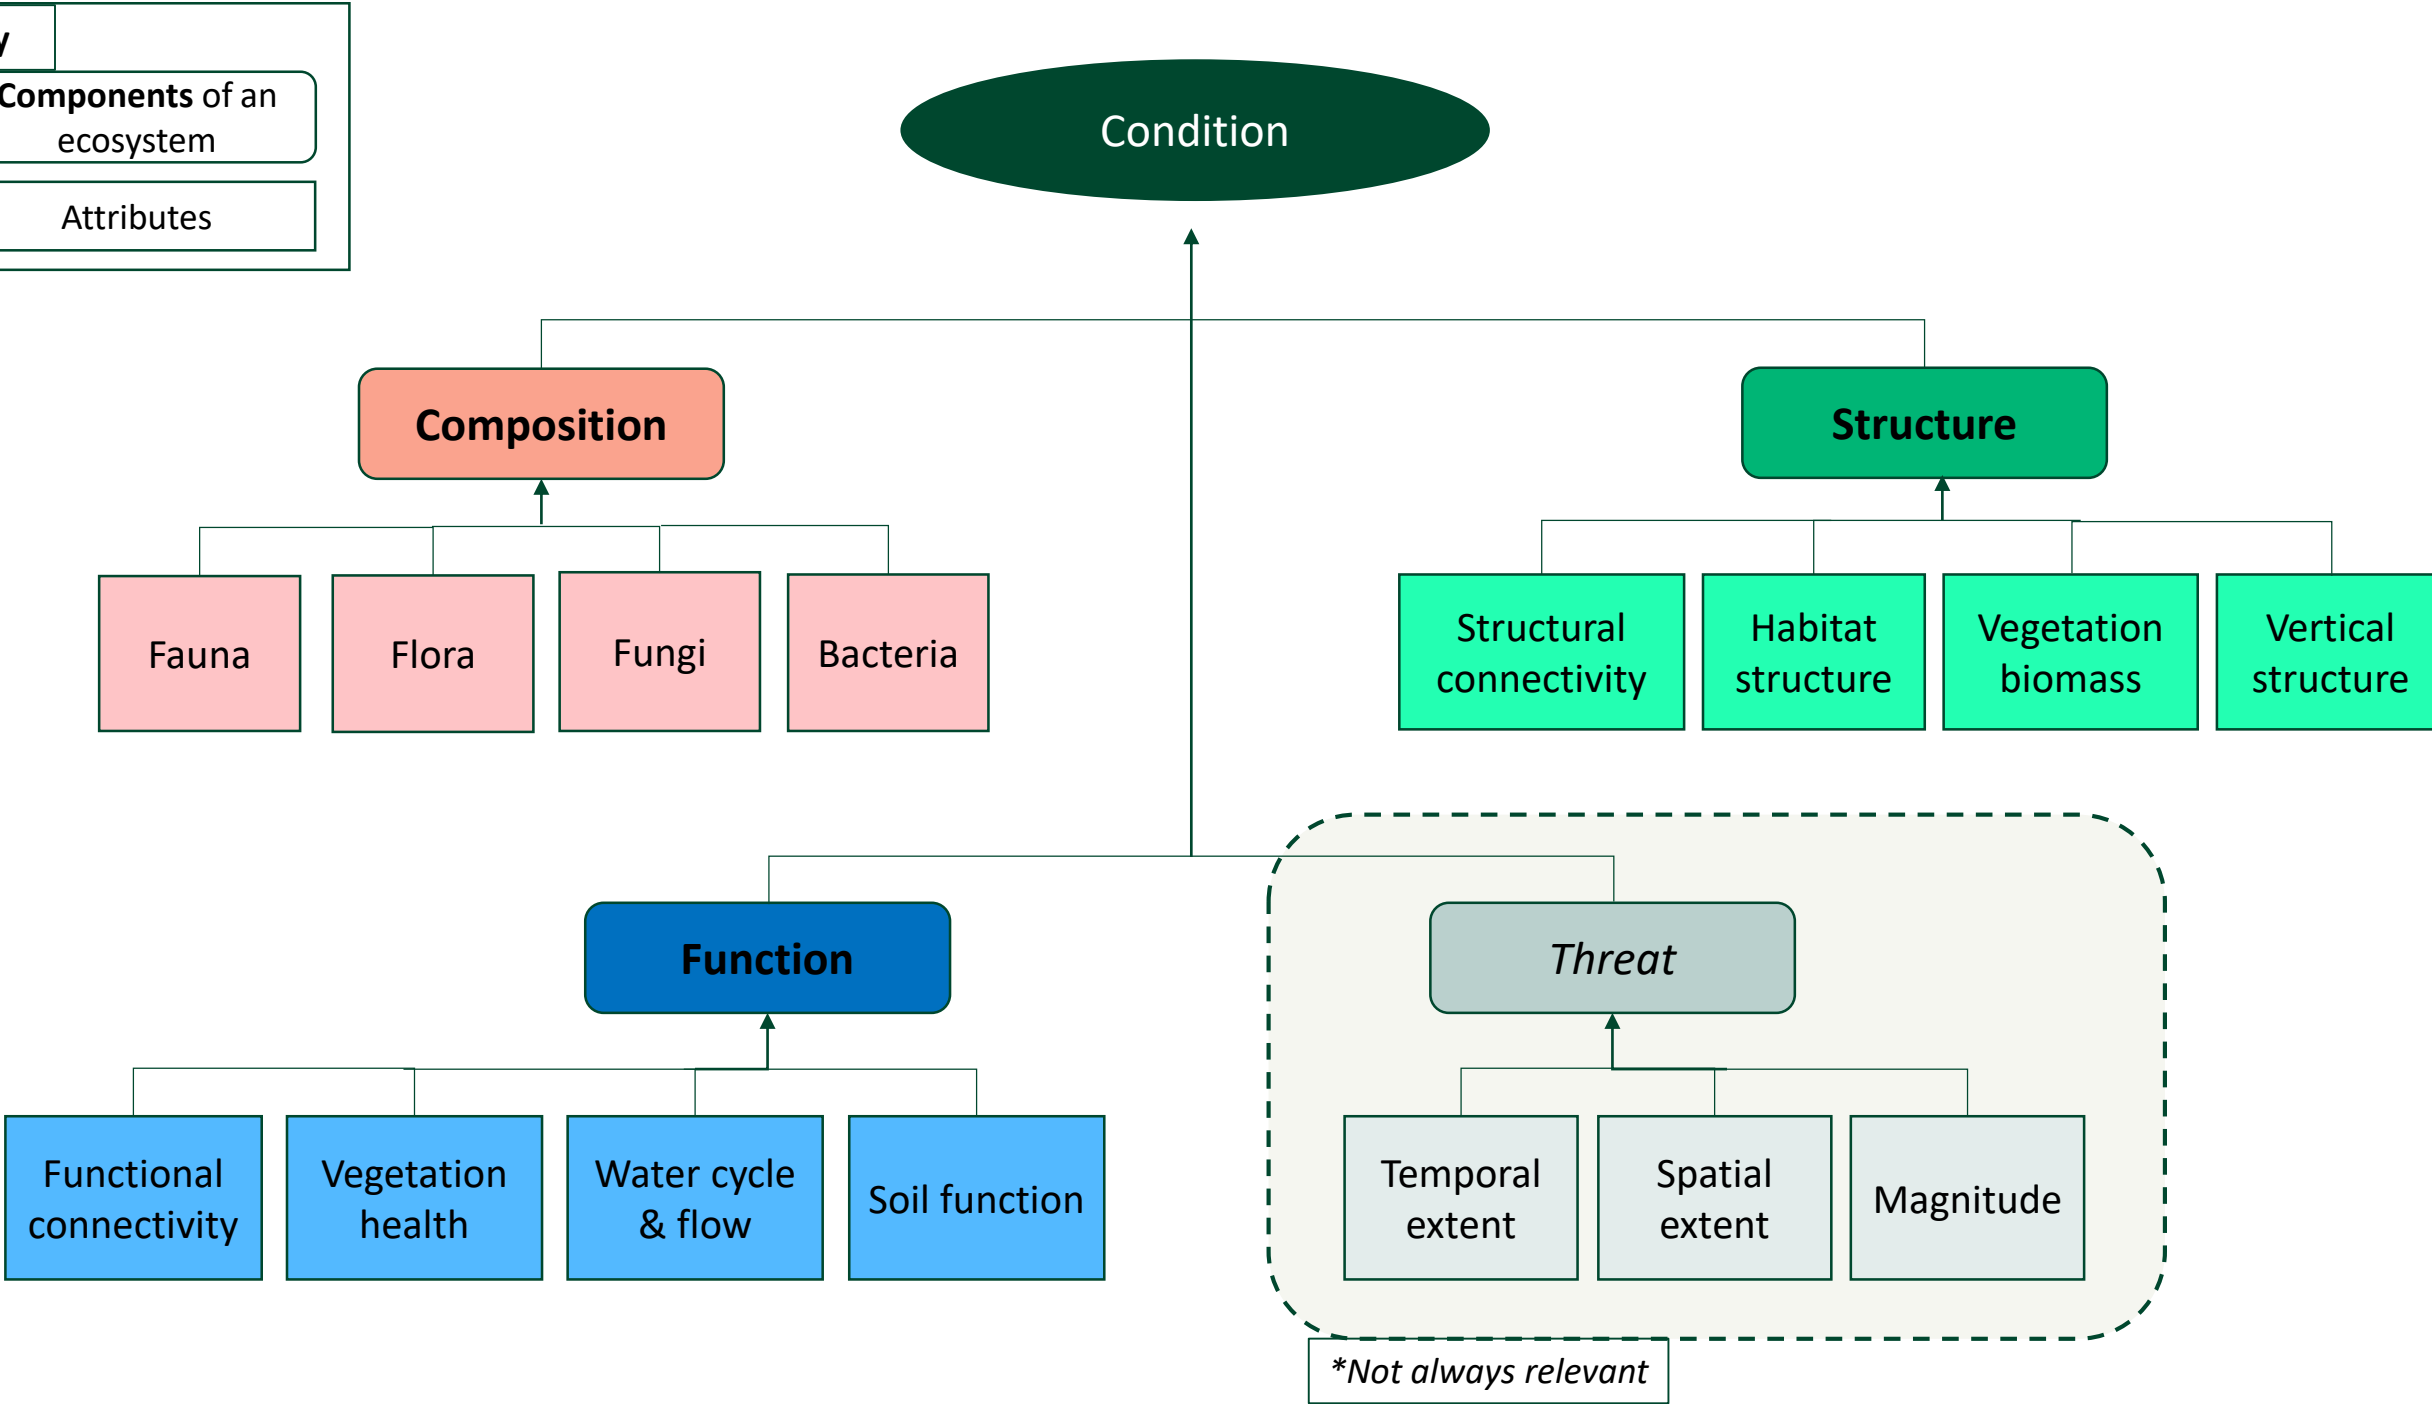

- Fauna
- Flora
- Fungi
- Bacteria

- Structural connectivity
- Habitat structure
- Vegetation biomass
- Vertical structure

- Functional connectivity
- Vegetation health
- Water cycle & flow
- Soil function

- Temporal extent
- Spatial extent
- Magnitude

*\*Not always relevant*

## Applying an ecosystem condition approach

- Evaluate components of ecosystem condition: **composition, structure, and function**
- Use tailored indicators specific to a ecosystem type
- Standardise to national ecosystem approaches or assessments, if available
- Utilize multiple survey tools (field assessments, remote sensing, eDNA)
- Consider scientific, traditional and Indigenous knowledge

## How can this inform the application of the mitigation hierarchy during the IA process?

- Applies ecological equivalence from avoidance to offsets during IA
- Enhanced spatial avoidance of high quality or good condition natural habitat areas
- Remove “grey” area between natural and modified habitat
- Identifies restoration potential in the study area
- Facilitates monitoring of change overtime
- Enhances feasibility of monitoring>NNL/NPI requirements

# Benefits of assessing baseline with an ecosystem approach

## Site level management

- ✓ Enhance decision making of land based management actions
- ✓ Facilitate monitoring and reporting of biodiversity management
- ✓ Facilitate reporting of biodiversity requirements for legislation, externally and internally

## Financial Institutions/Private corporations:

- ✓ Enhances reporting of biodiversity footprint impacts on ecosystems
- ✓ Facilitates monitoring and reporting of NNL/NPI commitments
- ✓ Informs state of nature and ecosystem integrity for voluntary disclosures (ie. TNFD)
- ✓ Integrate biodiversity at every decision making level

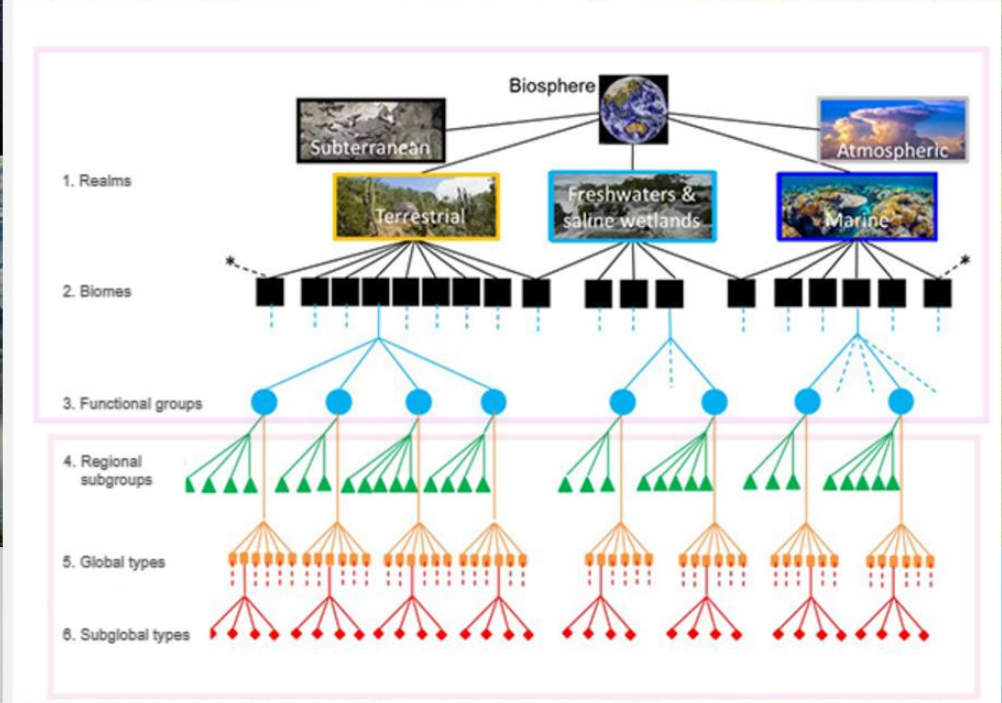

## Policy-makers:

- ✓ Aligns big picture pledges within Kunming-Montreal Global Biodiversity Framework goals and NBSAPs
- ✓ Address landscape change pressures by ecosystem
- ✓ Integrate spatial planning to address land use and sea use change
- ✓ Facilitate monitoring framework for the GBF goals

# Ambition with “dummy data”

Anglo American Quality Hectares | BU impact by sites & ecosystem types

Business unit: DEB | Site: All | Year: 2024

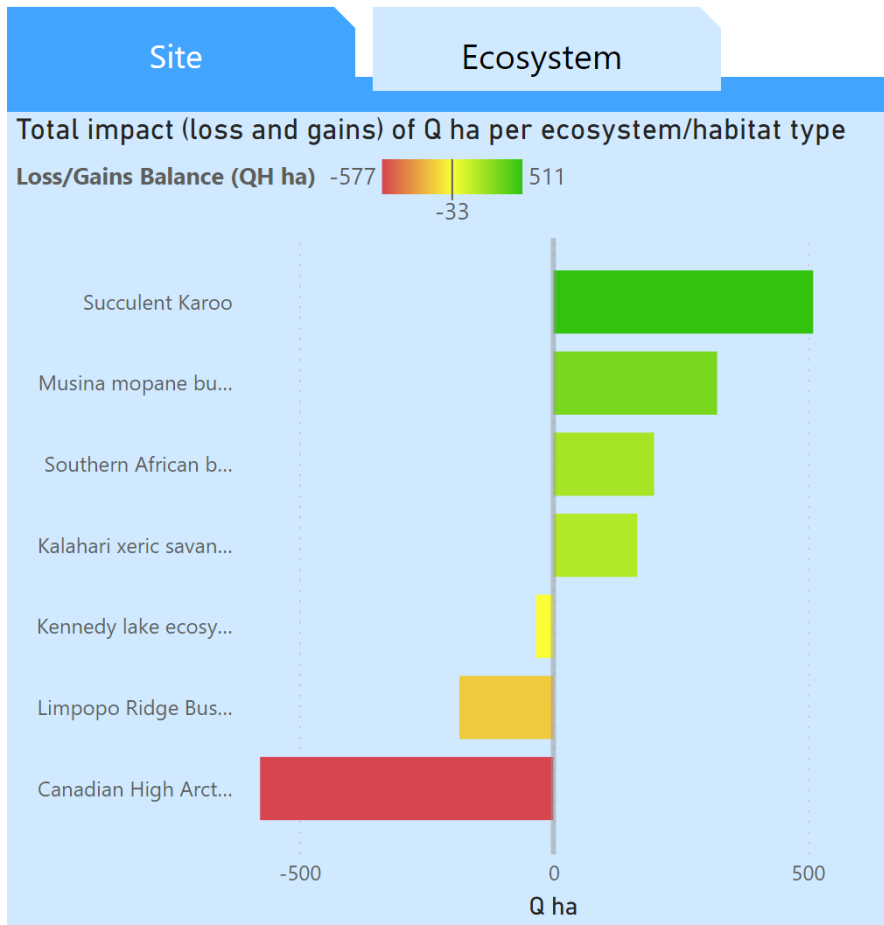

**-2805** Total Cumulative Loss

**400** Total Loss/Gains Balance

**2805** NNL target

**-86%** Progress to target

**3205** Total bio-management gains (Q ha)

| Ecosystem                   | Cumulative Loss (Q ha) | NNL target  | Loss/Gains Balance (Q ha) | Progress to NNL |
|-----------------------------|------------------------|-------------|---------------------------|-----------------|
| Southern African bushveld   | -182                   | 182         | 198                       | 9%              |
| Kennedy lake ecosystem      | -189                   | 189         | -34                       | -118%           |
| Musina mopane bushveld      | -233                   | 233         | 322                       | 38%             |
| Kalahari xeric savanna      | -240                   | 240         | 165                       | -31%            |
| Succulent Karoo             | -344                   | 344         | 511                       | 49%             |
| Limpopo Ridge Bushveld      | -760                   | 760         | -185                      | -124%           |
| Canadian High Arctic Tundra | -857                   | 857         | -577                      | -167%           |
| <b>Total</b>                | <b>-2805</b>           | <b>2805</b> | <b>400</b>                | <b>-86%</b>     |

**450** Rehabilitation (Q ha)

**2055** Restoration (Q ha)

**700** Offsets (Q ha)

## Quantifying NPI in practice

Integrating *area x condition* metric allow for in project life cycle planning processes to identify future land use

### Current work...

Mine closure in Newfoundland, Canada

- Restoration of Boreal Forest ecosystem

Smelter in BC Canada

- Revegetation after significant die off of vegetation from air emissions

Mine in Australia

- Long list of compliance monitoring requirements
