Agenda

Community health and safety at Anglo American

Internal evaluation

Moving beyond Sites

From HIA to HiAP

Anglo American Social Way 3.0

An integrated management system for social performance

Social performance activities are focused on **minimising or avoiding adverse impacts** and creating an environment where stakeholders affected by our operations can prosper sustainability.

Site leadership is accountable for providing direction, resources and management systems to effectively implement the Social Way Policy as part of an integrated approach to identifying and managing impacts and risks.

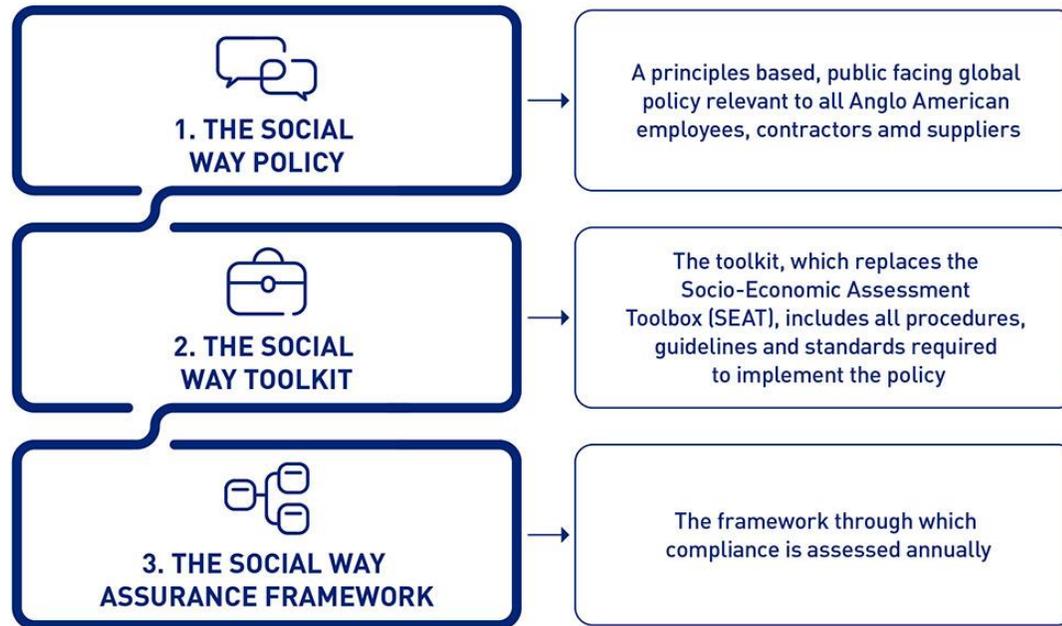

<https://socialway.angloamerican.com/en/toolkit>

THE SOCIAL WAY POLICY

4C. Community Health & Safety Management

The **health and safety impacts of our activities on local communities** will be identified, assessed and managed through the **impact assessment and management process**, aligned with the requirements of **IFC PS 4**

1. Governance

2. Review and Planning

3. Engagement and Analysis

3A Stakeholder Engagement

3B Incident and Grievance Management

3C Social and Human Rights Impact and Risk Analysis (SHIRA)

SW3.0 structure and content

4. Impact and Risk Prevention and Management

4A Socio-Economic Development (SED)

4B Contractor Social Management

4C Community Health and Safety Management

4D Emergency Preparedness and Response Planning

4E Security Management & the Voluntary Principles on Security and Human Rights (VPSHR)

4F Land Access, Displacement and Resettlement

4G Site-Induced Migration (SIM)

4H Cultural Heritage

4I Indigenous Peoples

4J Conflict Management

4K Artisanal and Small-Scale Mining (ASM)

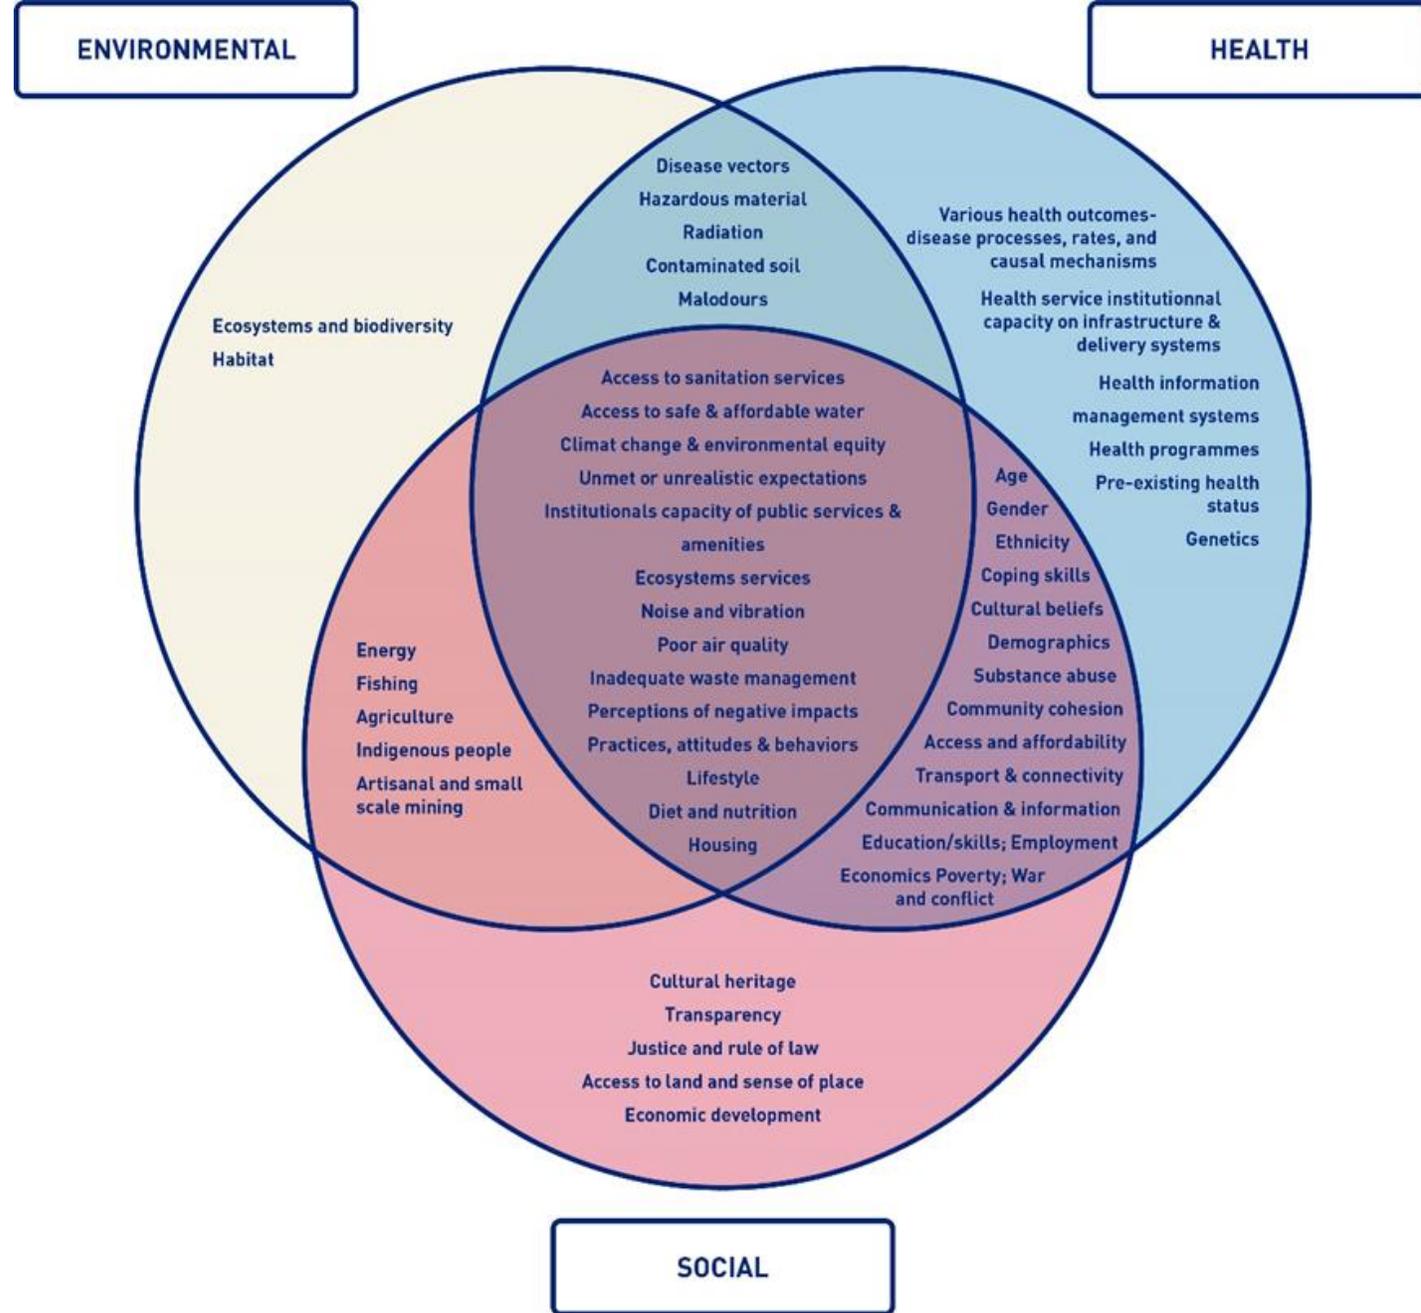

Which kind of **health and safety impacts**?

Community Health and Safety Areas (CHSA)	
1. CHSA	Communicable diseases linked to the living environment and housing
2. CHSA	Vector-related diseases
3. CHSA	Soil-, water- and waste-related diseases
4. CHSA	Sexually-transmitted infections, including HIV/AIDS
5. CHSA	Food- and nutrition-related issues.
6. CHSA	Non-communicable diseases
7. CHSA	Accidents/injuries and safety related issues
8. CHSA	Veterinary medicine and zoonotic diseases
9. CHSA	Environmental determinants of health
10. CHSA	Social determinants of health
11. CHSA	Health seeking behaviour and cultural health
12. CHSA	Health systems issues

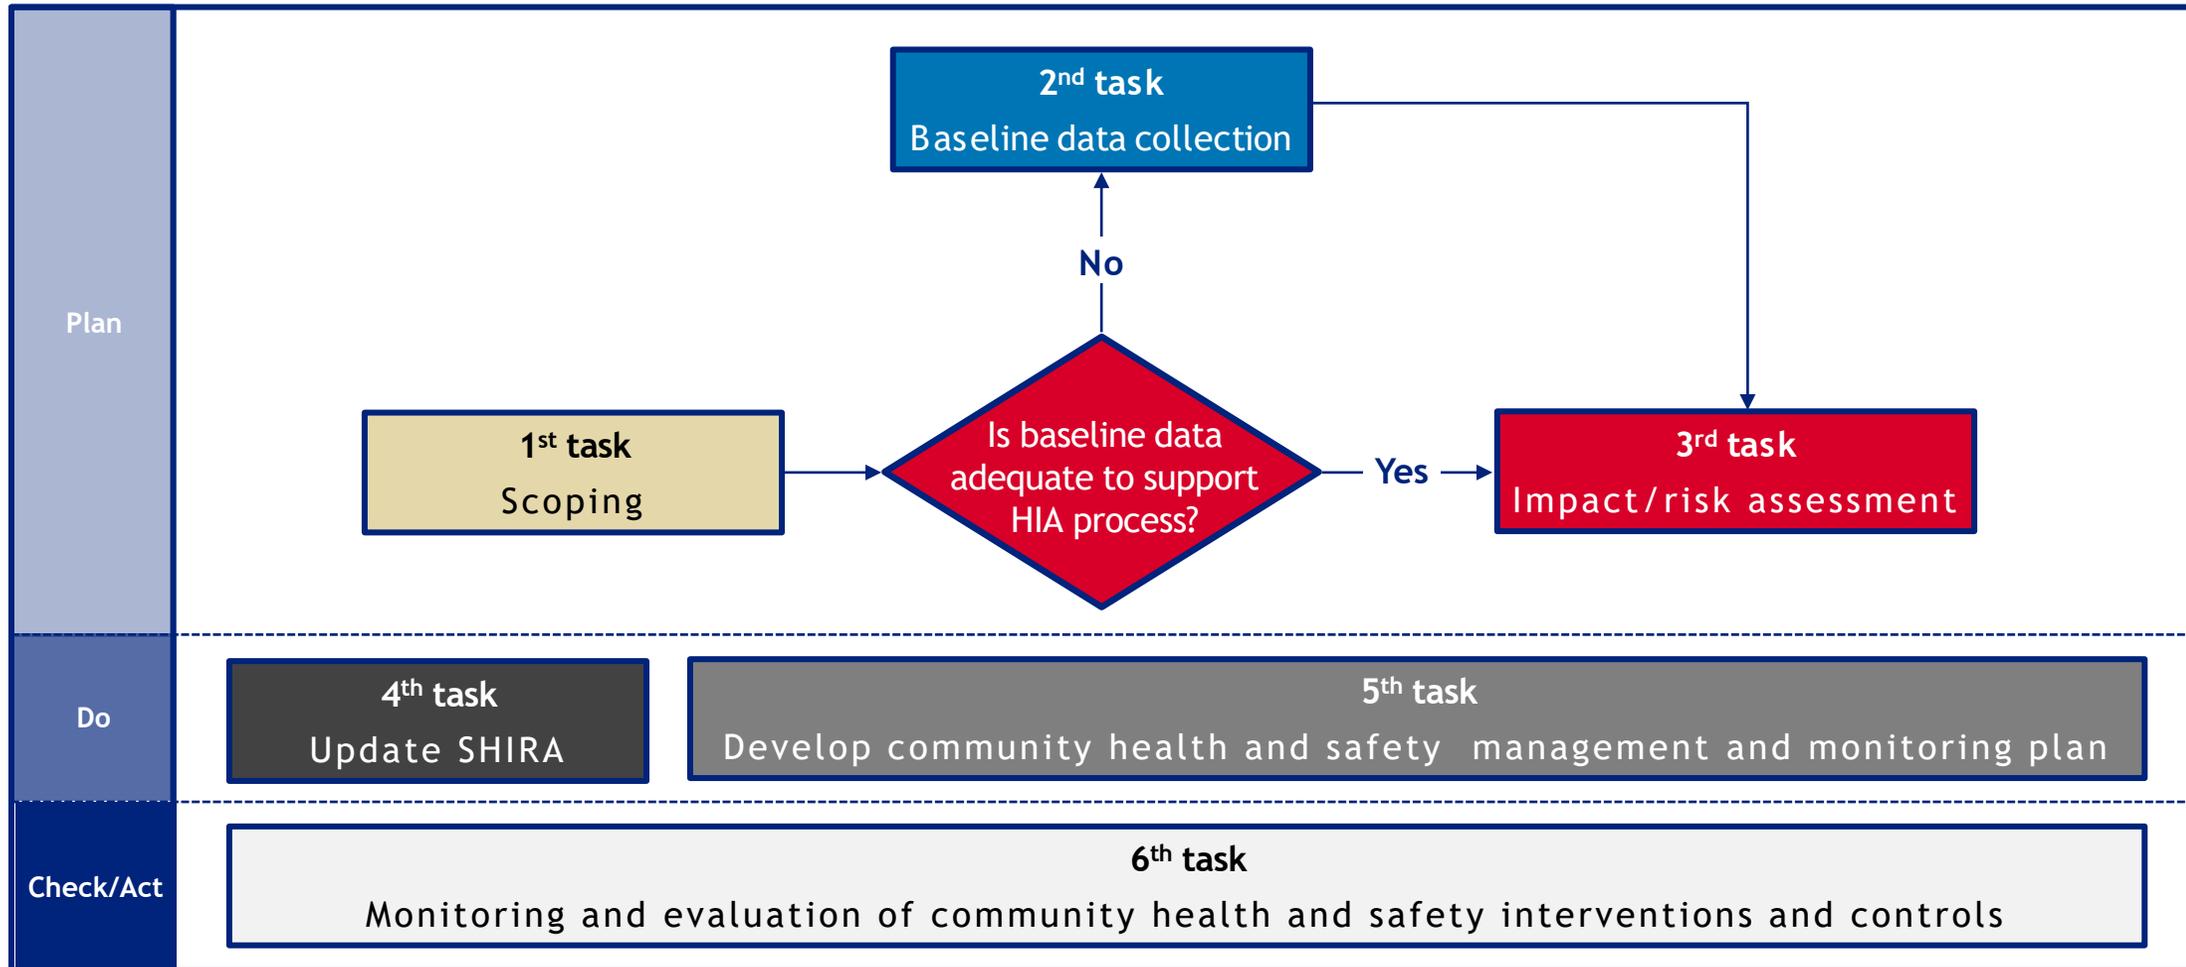

CHSA = Environmental Health Areas (EHA) of IFC guidance on HIA

Key environmental, social and health issues and their interrelationships

<https://socialway.angloamerican.com/en/toolkit>

Health Impact Assessment process

Other AA policies and commitments

Environment

Healthy Environment

- Climate change
- Biodiversity
- Water usage

Social

Thriving Communities

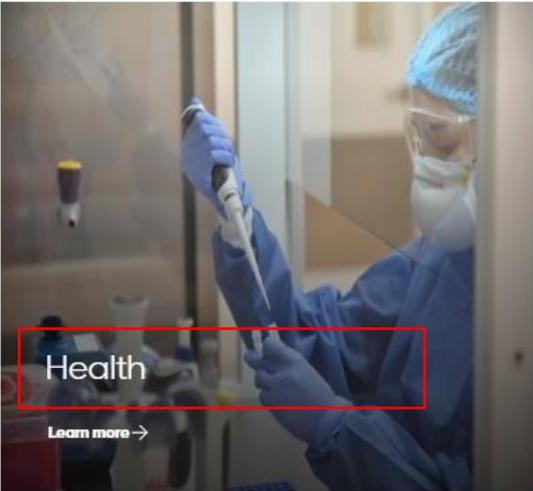

- Education
- Health and wellbeing
- Livelihoods

Governance

Trusted Corporate Leader

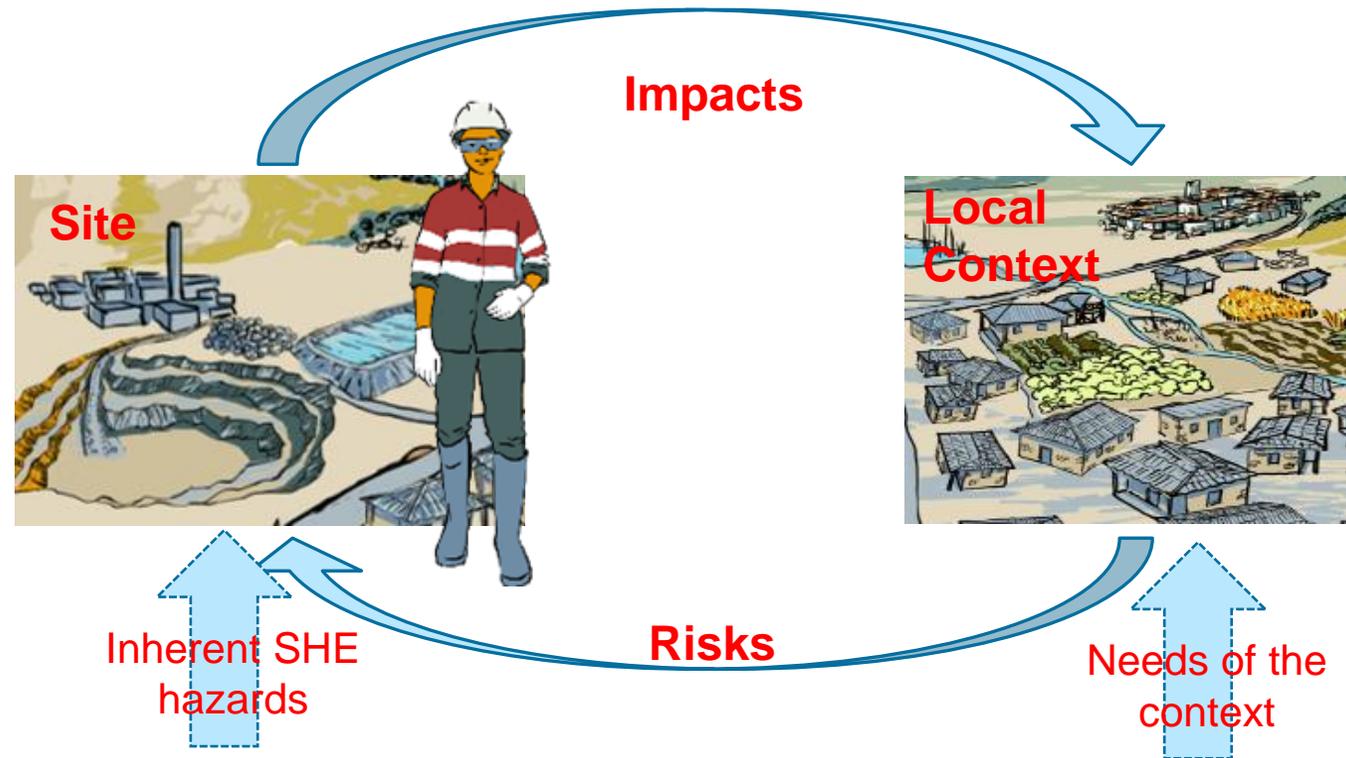

- Accountability
- Policy advocacy
- Ethical value chains

The Health and Wellbeing Goal is “To contribute to the achievement of SDG 3 in selected host communities by 2030”

Providing expertise and leadership in occupational health, personal health and well-being, emergency response and pandemic resilience across Anglo American.

Health, Operations and Workers, Communities, are all connected

Internal evaluation -2023

Similarities, level of controls, siloes and crosscutting issues & sustainability, and more

HIAs conducted show that risks/impacts identified present:

- similarities across the same type of sites: e.g mine or processing sites
- similarities across geographical settings: e.g. migrant mining workers in Southern Africa region and control of TB

Several impacts/risks identified have a structural pathway and require commitment and management support from Group or Business Units, before being tackled at site-level. E.g.: Gender Based Violence is a societal problem exacerbated by some of the site's working environment. AA has a group policy and curriculum that allows Sites to draw from it to implement locally.

Cross-cutting issues affect more than one requirement: e.g. site-induced migration(SIM) has its own management process. However, SIM triggers several CHS impacts and risks as well, so coordination is essential as siloed approach does not lead to adequate management.

Sustainability and cumulative impacts: factors such as climate change and unpredictability of climate patterns, increasing and competing water use demands, degradation of ecosystem services, and changing socio-economic circumstances all add complexity to assessing and managing the health impacts and risks to population health at site level

Internal evaluation -2023

internal and external challenges

Internal CHS capabilities and capacities at Sites are limited

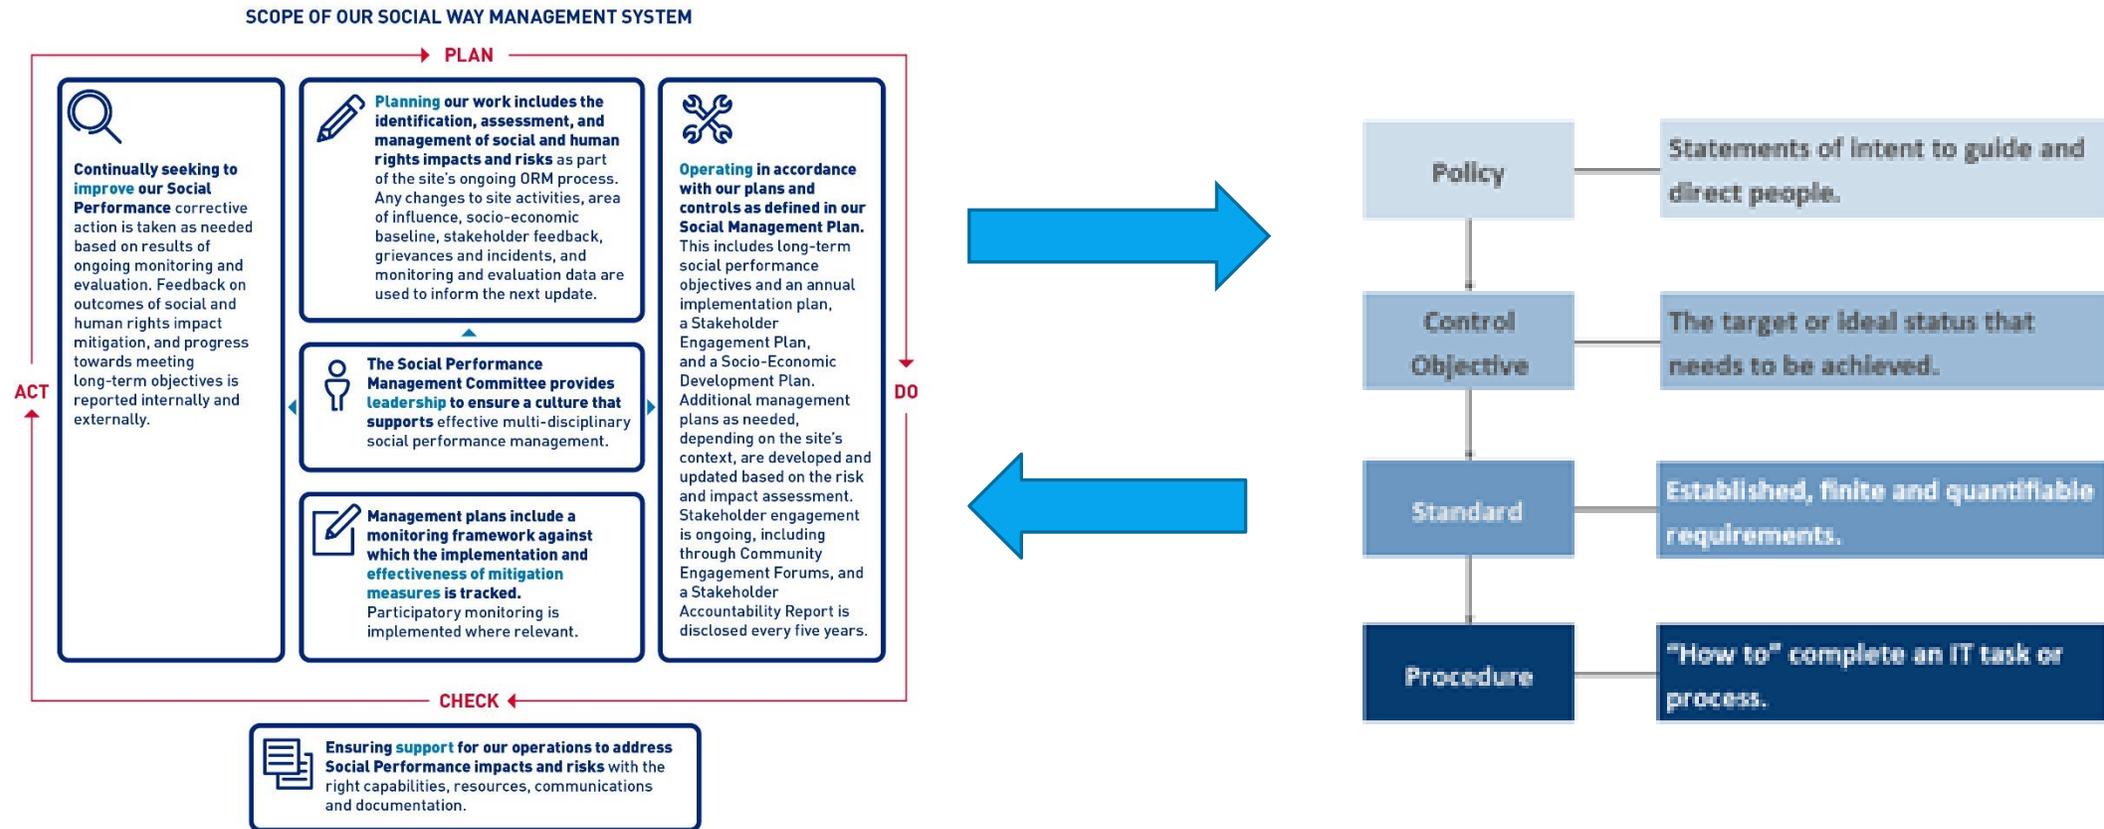

- each site should nominate a CHS lead
- each site should have established a CHS Steering Committee to supervise the 4C implementation and report to the Social Performance Management Committee (SPMC) PMC.

Reliance on external consultants, but their capabilities and capacities in countries are also limited

Complexity of the AA System affects the quality of the HIA and undermine the resulting CHS management plans

All projects undergoing HIA are already operational (and some are expanding or changing). The HIAs conducted struggled to differentiate between actual from potential CHS impacts and risks

From HIA to HiAP, and back

From the HiAP framework relevant for this process

Key activities include the following:

- Begin strategic planning and prioritization.
- Assess health, equity, and health systems- related implications of policies.
- Understand the country context, the capacity of government structures, and that of our own Sites for “HiAP”.
- Outline immediate, medium and long-term priorities.
- Assess internal policy within different geographical contexts.
- Map regulatory, oversight, and implementation capacity and the financial, institutional, human, and technical resources that are needed

Additionally key governance aspects address the tactical and technical aspects

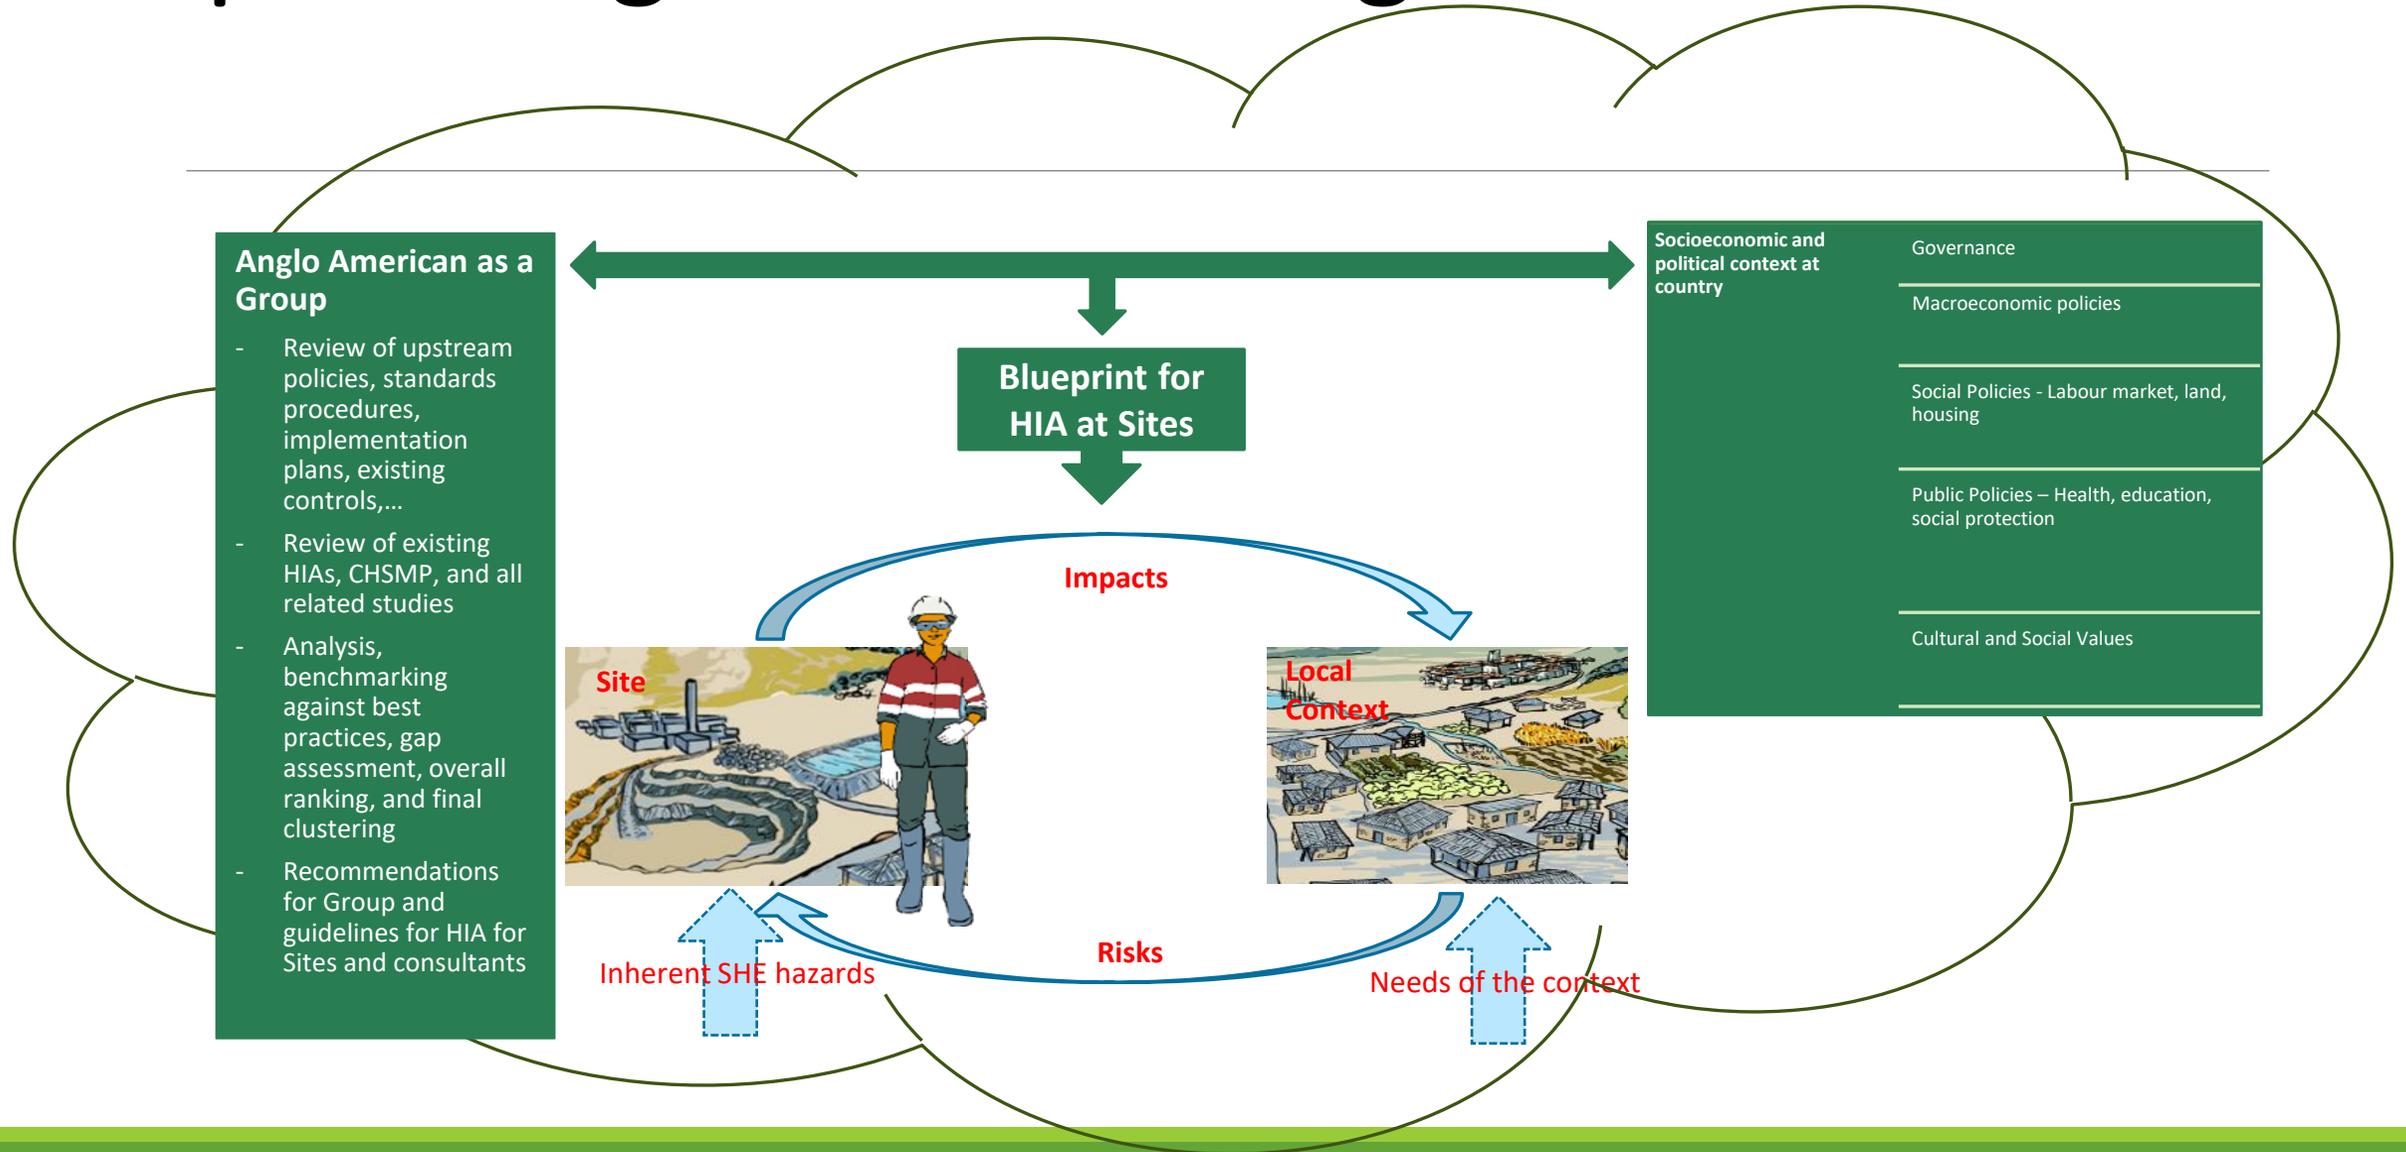

- A steering group composed of key stakeholders within AA will supervise the review
- A participatory approach will ensure technical experts provide ongoing inputs

Internal alignment review

Review is organized around three phases and different components. Although they are described in a linear order, the work carried in a component might overlap with others, so the process is more dynamic than presented.

1. Kick Off
2. Mapping and analysis of the alignment between 12 CHS areas and AA context
3. Review of the existing 4C documents prepared by sites globally
4. Characterization and ranking of the issues around typologies of risks
5. Analysis and clustering of the existing or additional controls and
6. Gaps assessment
7. Recommendations for BU/Regions/Group
8. Blueprint for sites
9. Test of the blueprint at one sites

Empowering Sites to manage CHS

Let's continue the conversation!

Post questions and comments in the IAIA24 app.
